Item 1

AstraZeneca completes sale of interest in Advanta BV

Following its earlier announcement in May, AstraZeneca PLC confirmed today that together with its joint venture partner, Royal Cosun, it has completed the sale of Advanta BV to Syngenta.

An exceptional gain of around \$220 million on the sale of its 50 per cent interest will be included in AstraZeneca's third quarter and nine months results announcement for 2004.

Item 2

**FDA ADVISORY COMMITTEE RECOMMENDS FURTHER DATA
TO SUPPORT APPROVAL OF ASTRAZENECA'S
ORAL ANTICOAGULANT EXANTA (XIMELAGATRAN)**

AstraZeneca today announced that the Cardiovascular and Renal Drugs Advisory Committee to the US FDA has advised that more data is needed to support the approval of the oral anticoagulant Exanta (ximelagatran).

Despite the Committee members' recognition of the need for a new oral therapy to complement warfarin in the treatment of thrombotic disorders, the Committee advised that the indications for the prevention of strokes in patients with atrial fibrillation (AF), for the prevention of blood clots in patients undergoing knee replacement surgery, and for the long term secondary prevention of blood clots following standard treatment of a clot, should not be recommended on present data.

Sir Tom McKillop, Chief Executive of AstraZeneca, said "We are disappointed with the outcome of the Advisory Committee, particularly for patients who need an effective alternative therapy to warfarin, the only existing oral anticoagulant. We will now continue our discussions with the FDA on a way forward for Exanta."

Exanta is an investigational oral direct thrombin inhibitor (oral DTI) and is poised to be the first oral anticoagulant since the development of warfarin more than 50 years ago. More than 30,000 patients in over 25 countries have participated in the clinical trial programme for Exanta to date, with more than 17,000 patients receiving Exanta. Exanta was studied as a fixed, oral dose with no titration or coagulation monitoring.

Item 5

**NEW INDICATIONS FOR NEXIUM®
IN HEALING AND PREVENTION OF NSAID-ASSOCIATED ULCERS**

Edgar Filing: ASTRAZENECA PLC - Form 6-K

AstraZeneca today announced that the Mutual Recognition Procedure (MRP) for new indications for Nexium® (esomeprazole) has been successfully finalised. The new indications are for the healing of gastric ulcers and, for patients at risk, the prevention of gastric and duodenal ulcers, associated with non-steroidal anti-inflammatory drug (NSAID) therapy. The company is now awaiting individual national approvals.

Nexium® is proven to be fast and effective in healing gastric ulcers in patients taking NSAIDs, including COX-2 selective NSAIDs. In addition, it is proven to be effective in preventing gastric and duodenal ulcers associated with all NSAIDs, including COX-2 selective NSAIDs.

Approximately 30 million people worldwide take NSAIDs on a daily basis to reduce inflammation and alleviate pain and they are the gold standard treatment for the majority of arthritic diseases and for treating chronic pain. However all NSAIDs carry a risk of upper GI side-effects, placing a significant burden on patients, the medical profession and the healthcare system.

It has been estimated that 15 to more than 40 per cent of NSAID users experience upper GI symptoms such as dyspepsia, abdominal pain, heartburn and nausea and as many as 15 to 30 per cent of long-term NSAID users develop peptic ulcers. A major concern with NSAID use is the life-threatening risk of peptic ulcer complications, such as bleeding and perforation.

Nexium® is an established treatment for gastroesophageal reflux disease (GERD). GERD is a common condition that can significantly impair quality of life. It is characterised by reflux of gastric acid from the stomach into the esophagus, causing upper GI symptoms such as heartburn and acid reflux. Erosive esophagitis (inflammation of the esophagus) is often present.

Nexium® belongs to the class of drugs, proton pump inhibitors (PPIs). PPIs work by blocking the production of gastric acid which can irritate the lining of your esophagus, stomach and duodenum (the top end of your small intestine).

1

Effective control of gastric acid secretion is a key factor in the management of GERD and NSAID-associated upper GI side-effects. Nexium® has been shown to provide more effective control of gastric acid secretion than all other PPIs. It works by deactivating the proton (acid) pumps that produce stomach acid. This reduces the amount of acid that is in the stomach, helping to treat heartburn and other symptoms of GERD.

Regulatory applications for the use of Nexium® for the healing of NSAID-associated gastric ulcers and prevention of NSAID-associated gastric and duodenal ulcers in patients at risk, were submitted in the US and other global markets earlier this year. Discussions with these regulatory authorities are ongoing and further approvals are anticipated in the coming months.

During the first half of 2004, Nexium® worldwide sales increased by 20 per cent to \$1,826 million. Nexium® has been launched in 89 countries and in sales terms, is the world's fastest growing PPI treatment on an annual basis.
