ICONET, INC.

(Former name or former address, if changed since last report)

ITEM 9 - REGULATION FD DISCLOSURE

ANGLOTAJIK MINERALS, INC.

FOR IMMEDIATE RELEASE

ANGLOTAJIK MINERALS ANNOUNCES REQUEST AND REPORTS

Edgar Filing: ANGLOTAJIK MINERALS INC - Form 8-K

Dec 1, 2003 Los Angeles, California.- Anglotajik Minerals, Inc. (OTC Bulletin Board AJKM) through it's corporate Executive Director in Dushanbe, Georges Al-Zein, today announces receipt of a formal request from the Ministry of Industry as noted in the release of November 24th, 2003. This request confirms the Government of Tajikistan desire to enter into a formal and final agreement between the Tajikistan Ministry of Industry, the Tajik Geological Committee and Anglotajik Minerals Inc. Plans are currently underway for Management of Anglotajik Minerals Inc., to travel to Dushanbe, the capital of Tajikistan within the next 15 days for scheduled Ministry level meetings with the Minister of Industry and official Deputies.

Documentation, provided through the Government has identified several deposits of interest, all of which are contained within a 400 sq km area known as the Rushan Complex. Extensive Soviet exploration work has been performed on a number of these deposits from 1970 thru 1977.

Anglotajiks initial exploration interest is in both a tungsten/gold deposit and a separate silver deposit. Current Soviet exploration document indicates the tungsten/gold deposit as of having, on surface, 8 mineralized segments which have been identified along a trend extending for approximately 1km. Trenches 1m wide by 1m deep totaling 2183 meters, have been excavated and sampled across mineralization which varies in width from 0.6 to 3.9 meters. An Adit, excavated at an elevation level of 2770 meters is documented to be 2354 meters (2.35 Kilometers / 1.46 miles) deep consisting of 2m wide by 3m high drifts and crosscuts, some 160-340 meters beneath the surface exposures. Diamond drilling was completed from surface (5 holes totaling 1515 meters) and underground (17 horizontal holes totaling 2737 meters and 12 holes angled down totaling 2978 meters) in all totaling 7230 meters (7.23 kilometers / 4.493 miles). The Soviet compilation of these exploration results indicates average grades of various mineralized units that range from 2 - 9 gms/tonne Au, 2-9 gms/tonne Ag, 0.1 - 0.8% WO₃, 0.1 - 0.4% Cu and 0.05 - 0.4% Co. These results were broadly confirmed by independent North American investigators, subject to certain qualifications on sample sizes and exact locations.

Anglotajik Minerals Inc. management recognizes that the previous Soviet Exploration of 1978, as well as the most recent independent North American Report of late 1997, must now be verified by western metal measurement standards. A complete evaluation plan, initially including re-sampling of mineralization in the Adit level workings and underground diamond drilling of holes, angled upward to evaluate the continuity of mineralized zones between the surface and Adit level, is recommended and currently being addressed.

Soviet Exploration grades reported within the Silver deposit indicate mineralization ranging between several grams Ag., per tonne and 22,790 grams Ag., per tonne. These were identified in fault and fracture controlled quartz veins across widths varying between 0.5 to 1.5 meters. Many veins and structures are listed within the 1978 Soviet exploration documents, but maps and section identifications have not yet been made available. Current evaluations regarding procedures to clarify and confirm these measurements to western metal measurement standards are being addressed.

It is anticipated that Anglotajik Minerals Inc., will begin its independent review of several other noted deposits of interest located within the Rushan Complex including the Barch, Huff and Rangkul' Skoye, commencing this month.

Anglotajik Minerals is a US resource company, focusing on the exploration and advancement of mineral assets in Tajikistan.
